

Emissions into air by industry 2013

Greenhouse gas emissions grew in energy supply and transportation in 2013

Greenhouse gas emissions produced by Finnish residents in Finland and abroad amounted to nearly 68 million tonnes in 2013. The growth from the year before was 2.8 per cent. In energy supply, the use of hard coal grew by over one-third, replacing the use of peat and natural gas, as a result of which greenhouse gas emissions in the industry increased by eight per cent. In water and air transport, the growth in the amount of fuel used by Finnish residents abroad increased the industry's greenhouse gas emissions by around ten per cent. The share of energy supply in greenhouse gas emissions was biggest, 28 per cent, the share of manufacturing was 21 per cent, that of transportation and storage 17 per cent, and that of agriculture 11 per cent. Households' share of greenhouse gas emissions was nine per cent.

Greenhouse gas emissions by industry 2012 and 2013, million tonnes CO₂ equivalent

Finnish residents produced 37 million tonnes of organic carbon dioxide emissions, which was two per cent more than in the year before. The growing use of biofuels has increased the carbon dioxide emissions generated by them. Emissions grew most in volume in the forest industry, where slightly over one-half of all organic carbon dioxide emissions are generated. Growth was also strong in waste management as incineration of waste is becoming more common. Organic carbon dioxide emissions are not included in greenhouse gases.

In other types of emissions, most significant changes concerned the growth of sulphur and nitrogen dioxide emissions in water and air transport. Sulphur dioxide emissions in water transport went up from 21,500 to 24,000 tonnes, which stands for one-third of all sulphur dioxide emissions. Nitrogen dioxide emissions in water and air transport grew by 17 per cent to around 70,000 tonnes, representing one-third of all nitrogen dioxide emissions.

In addition to the above, Statistics Finland's statistics on emissions into air by industry include particulate matter emissions and emissions of non-methane volatile organic compounds (NMVOC).

Emissions into air by industry groups 2013, tonnes

The statistics on emissions into air by industry are calculated according to the EU Regulation on environmental accounts. The industrial classification and division used in the statistics differ from the sector division used in the reporting of the greenhouse gas emissions to the UNFCCC. The statistics do not take into consideration the amount of carbon dioxide absorbed by forest or other vegetation either.

Differing from the greenhouse gas inventory and greenhouse gas reporting, the statistics on emissions into air by industry also contain Finnish residents' emissions from land, water and air transport abroad. In turn, emissions by foreign citizens from transport on Finnish territory are subtracted from the emissions into air by industry. The definition of transport corresponds with the methods of national accounts in which

households' transport is included in private consumption. Due to definitional differences, the total volume of greenhouse gas emissions by industry is higher than in the Greenhouse Gas Inventory reported to the UNFCCC.

The calculation of greenhouse gas emissions has changed due to the revised, internationally agreed methodological and reporting guidelines in the second commitment period of the Kyoto Protocol (2013 to 2020). Finland's emissions level from 1990 onwards rose by one to three per cent, depending on the year.
